## List of Figures

# 1 Problem Statement

This assignment is to use Python and git.

We have to make a code that searches emoticons through a given file and the percentage of the number of times the emotion occurred. We have to print the mood of the *user\_1* available there in the file in the following format

*user\_1 : @user\_2 statement*

file from <https://github.com/shubhras01/Assignment9.git> can be taken

The output should be printed in a file. Also you need to add your files back on the github online repository created by you by the name *Assignment\_9*.

## 2 Assumptions

I have taken following assumptions while preparing solution to the given problem statement :

1. The code is limited for the givenfile.
2. The order can not be chnaged for any user in the file.

## 3 Logic Explanation

I have divided the complete problem statement into various modules and tried to understand, code and analyze these; collaborating to form the answer to the given problem statement. The complete logic and module description are as below :

### 3.1 The Python Code

#### 3.1.1 TASK 1 - Mood of the user

The code made includes first opening the file using *open()* function a read mode. I have created a list for each of the 5 users viz A, B, C, E, G so as to count corresponding emotions associated with them. Using a function *line.split()* the complete line fetched through the file is broken into words which are then compared with the available emotions and on matching the lists are getting updated.

A function/method named *maximum()* is called in which all the list elements are compared with one another and the index with maximum number associated with it is pulled out to return the mood.

The function is called for every user viz A, B, C, E, G.

#### 3.2 TASK 2 - Printing percentage of different moods

The complete file opened again to scan each line here too and directly all the emotion symbols are compared with the words and the values are stored in a counter created for separate emotion namely *emoHappy*, *emoSad* etc.

Then using simple mathematics and *print* command the result is displayed out.

## 4 Using Git

Here, firstly all the necessary file are forked from the link provided above in the problem statement into my github account. From there these files are cloned into the system local repository.

## 5 Screenshots

### 5.1 Screenshot 1 - Showing Final Output on Terminal

```
#####  
Output of TASK 1 is as follows  
A is Sarcastic  
B is Happy  
C is Happy  
E is Happy  
G is Surprised  
#####  
Output of TASK 2 is as follows  
Mood_Happy: 30.0 percentage  
Mood_Sad: 0.0 percentage  
Mood_Sarcastic: 11.0 percentage  
Mood_Surprised: 26.0 percentage  
Mood_Crook: 7.0 percentage  
Mood_Neutral: 15.0 percentage  
Mood_Angry: 7.0 percentage
